AGENDA

- What is Threat Modelling?
- How does it work?
- Threat Modelling Frameworks
- Conduct a Threat Analysis
- How to conduct threat modelling?
- Pros and Cons
- Best Practices and Brain Storming

WHAT IS THREAT MODELLING?

- It's Structured Process
- First thing first : **Bring me the diagram**
- **Range includes Network, Application, System, Distributed System, IoT devices, Business process and more.**
- Capturing, Organizing and Analyzing

WHAT IS THREAT MODELLING? (CONTD..)

- Objectives:
  - Identify Security Requirements
  - Pinpoint Security Threats
  - Potential Vulnerability
  - Prioritize Remediation

- Four Question Framework:
  - What are we working on?
  - What can go wrong?
  - What are we going to do about it?
  - Did we do a good job?

QUICK SUMMARIZE !

- Hunt Threats ahead i.e, at the time of Development

- Catch - Need to have right Security Mind-set

WE NEED SECURITY !

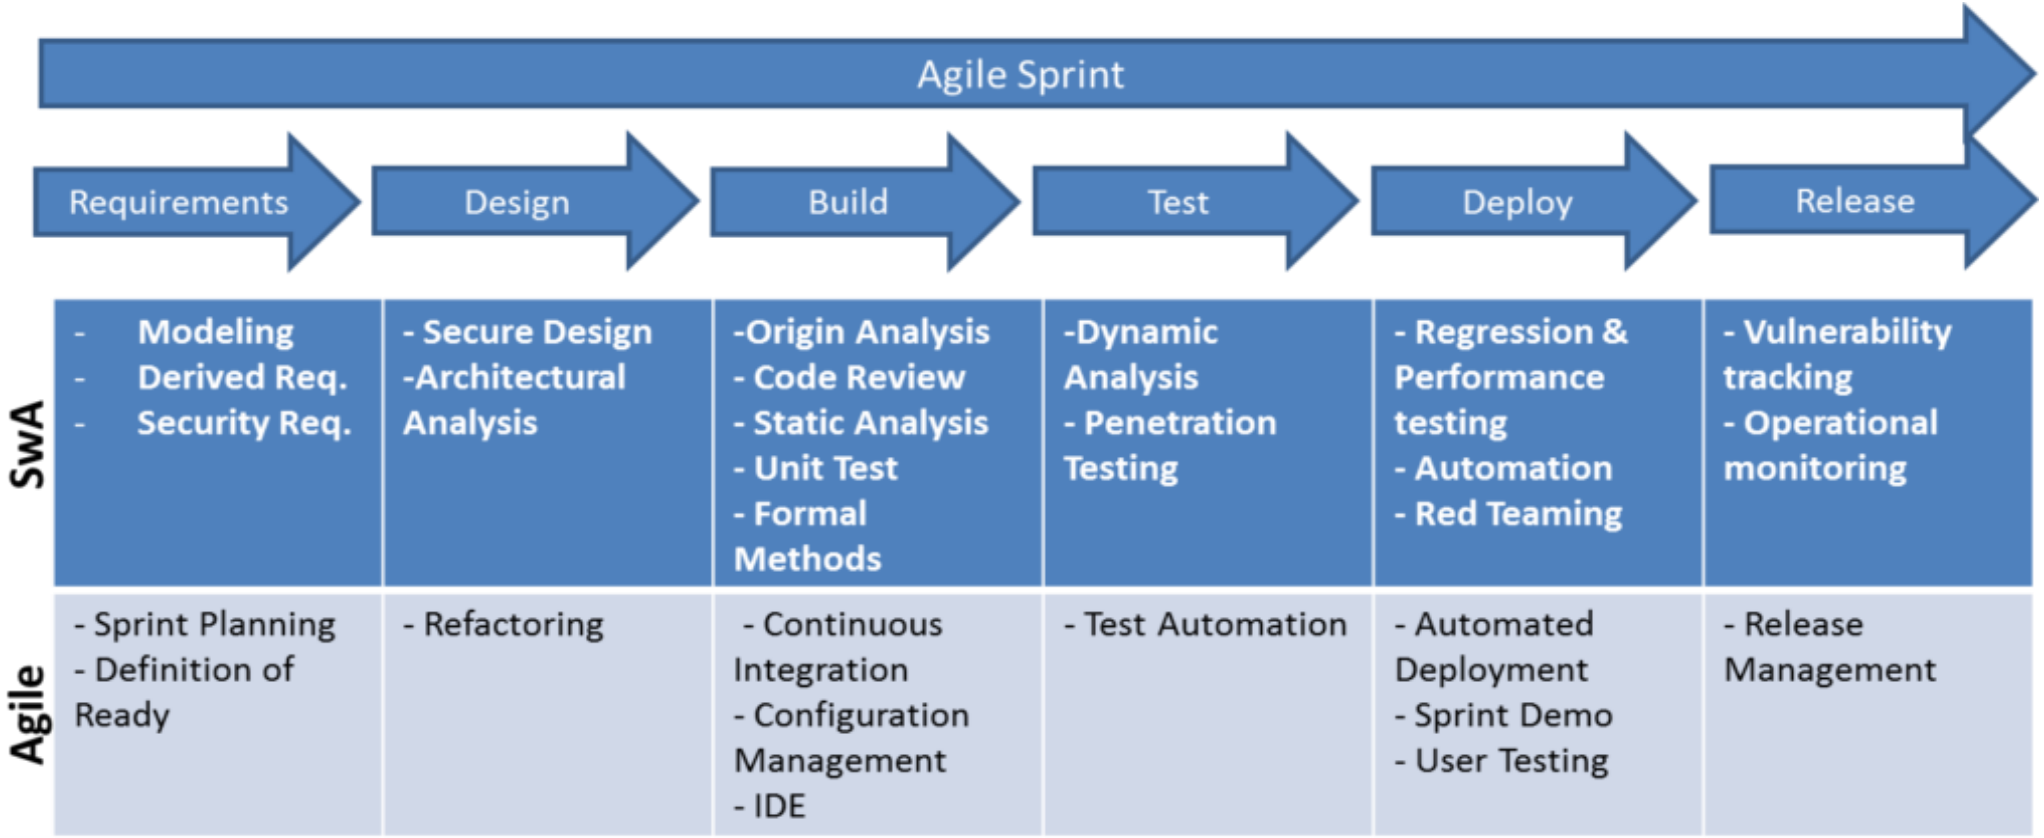

Figure 1: SDLC with Software Assurance and Agile Development Process Overlays

HOW DOES IT WORK?

- Let's Recall everything that we discussed in our Previous slide
- Steps:

1. **Bring me the diagram**: What we are building?
2. **Identify threats**: What could go wrong?
3. **Mitigating**: What we are doing to defend against the Threat?
4. **Validating**: Have we acted on each previous steps:?

THREAT MODELLING FRAMEWORKS

- STRIDE
- PASTA
- DREAD
- Attack Trees
- CVSS
- hTMM

Total Frameworks = 12

STRIDE

- Used to Identify the Threats
- Created by Engineers at Microsoft
- Guide the discover of threat within system
- Used along with Model of the Target System
- Most Effective for Evaluating Individual System

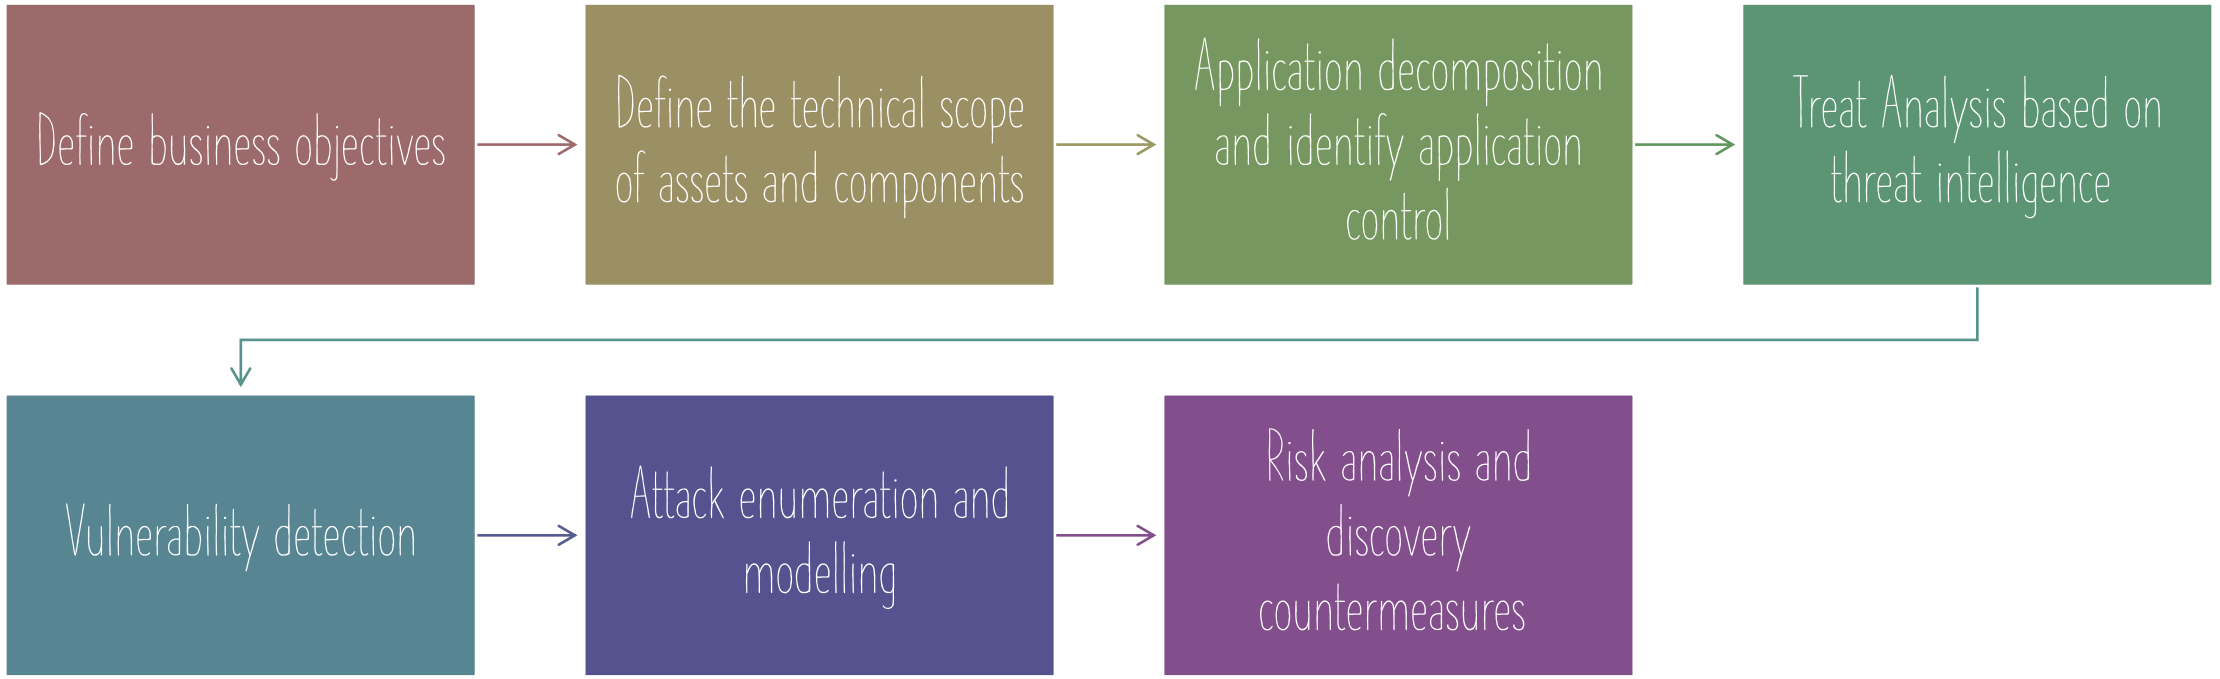
STRIDE (CONTD..)

- Spoofing
- Tampering
- Repudiation
- Information Disclosure
- Denial of Service
- Elevation of Privilege

PASTA

- **P**rocess for **A**ttack **S**imulation and **T**hreat **A**nalysis
- Attack Centric Methodology
- Consists of 7 steps
- Designed to correlate business objectives with technical requirements
- Dynamically identity, count and prioritize threat

PASTA (CONTD..)



Define business objectives
Define the technical scope of assets and components
Application decomposition and identify application control
Treat Analysis based on threat intelligence
Vulnerability detection
Attack enumeration and modelling
Risk analysis and discovery countermeasures

DREAD

- More focused on "Risk Analysis" and less on the "Threat Actor"
- DREAD stands for six questions you would ask about each potential threat:
  - Damage potential: How great is the damage if the vulnerability is exploited?
  - Reproducibility: How easy is it to reproduce the attack?
  - Exploitability: How easy is it to launch an attack?
  - Affected users: As a rough percentage, how many users are affected?
  - Discoverability: How easy is it to find the vulnerability?
- Each of these questions is answered with a rating between one and three.

STRIDE or PASTA or DREAD

- DREAD was conceived of as an add-on to the STRIDE model that allows modellers to rank threats once they've been identified.

- Use STRIDE to Identify the Threats & then use DREAD to evaluate Risk Associated with those Threats

- PASTA - Is it Attacker Centric or Risk Centric ? Well.. This debate is like Windows vs Mac which is best...

ATTACK TREE

- Attack trees are charts that display the paths that attacks can take in a system.
- These charts display attack goals as a root with possible paths as branches.
- When creating trees for threat modeling, multiple trees are created for a single system, one for each attacker goal.
- This is one of the oldest and most widely used threat modeling techniques.
- While once used alone, it is now frequently combined with other methodologies, including PASTA, CVSS, and STRIDE.

CVSS

CVSS v2.0 Ratings	
Low	0.0-3.9
Medium	4.0-6.9
High	7.0-10.0

CVSS v3.0 Ratings	
Low	0.1-3.9
Medium	4.0-6.9
High	7.0-8.9
Critical	9.0-10.0

- Common Vulnerability Scoring System
- It is a standardized threat scoring system used for known vulnerabilities.
- Developed by the National Institute of Standards and Technology (NIST) and maintained by the Forum of Incident Response and Security Teams (FIRST)
- Inherent properties of a threat and the impacts of the risk factor due to time since the vulnerability was first discovered.
- Measures that allow security teams to specifically modify risk scores based on individual system configurations.

HTMM

- Hybrid Threat Modelling Method
- hTMM is a methodology developed by Security Equipment Inc. (SEI) that combines two other methodologies:
  - Security Quality Requirements Engineering (SQUARE)–a methodology designed to elicit, categorize and prioritize security requirements.
  - Persona non Grata (PnG)–a methodology that focuses on uncovering ways a system can be abused to meet an attacker's goals.
- Accounts for all possible threats, produces zero false positives, provides consistent results, and is cost effective.

CONDUCT A THREAT ANALYSIS

- Checklist-based approaches.

- **Non-checklist-based approaches**. Generally, use creative methods (e.g., brainstorming) to identify attacks.

HOW TO CONDUCT THREAT MODELLING?

- Let's sit together and start Brain Storming !!!

1. Application
2. Cloud
3. Mobile
4. IoT
5. Network

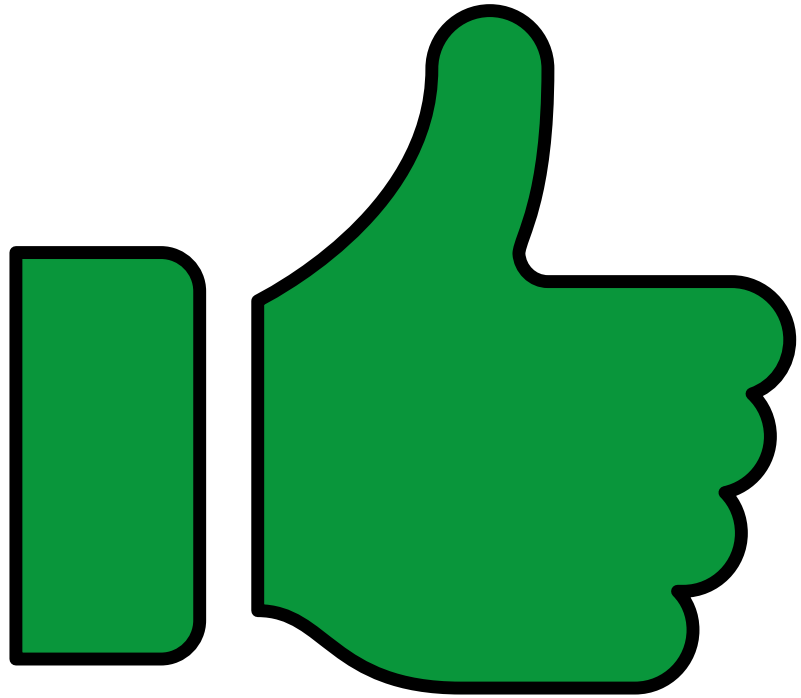
PROS

- Reduce attack Surface
- Prioritize Threat
- Mitigating efforts
- Identify and Eliminate single point of failure
- Understand the complete cyberattack kill chain
- Improve security posture
- Prioritize development and testing efforts



CONS

- Long run and Mystify
- Process gets long and complex
- Disconnected from the development process
- Did we get all threats?
- When to stop finding threats?
- Tracking

BEST PRACTICES AND BRAIN STORMING

Well... Every Security Professional/Organization have their own requirements & Standards.

Can't we have our own Framework to follow? Or Can't we merge more than 2 Framework? .... Of course, we can!

Why don't we use OWASP Based Threat Modelling Approach

Combine Threat Modelling Framework and make use of more than 2 as per your need.

BEST PRACTICES AND BRAIN STORMING (CONTD.)

Don't forget basic building blocks

- Infosec Policy
- Security Standards
- Security Controls

Don't Forget to Research & Analyze OWASP Threat Modelling Approach

Keep on researching and improving Security Posture

At the end of the Day, we are Human Being

Why don't we question ourself on Relevance

THANK YOU
